I host NRBoT's server (AOW SERVER) and when I try and use brenbot 1.40 it gives me a socket error, but that doesnt effect anything really, its my rg thats screwing up, when I want to disable it, it won't disable, I tried to put it on half-rg then in mIRC i try and do !set renguard off and it says something like this file is odsique, if you dont want the non-rg players to be kicked please turn on ur half-rg. (something like that). Can someone tell me how to get my rg working or tell me how to delete it or give me a less updated version without rg, because when I try and go in my game it says with a AMSG, DOWNLOAD RG AT http://WWW.RENGAURD.COM (says 2 times) then it kicks me, I'm running rg too..

-Thanks
