How much free space you got left on that drive? With Renegade, BF1924 and Quake2 on, as well as other programs I'm assuming, you must be getting pretty low on space. That may be causing you problems.

It also depends on how you put the hard drive into the new system. Did you do a fresh install of windows and all the programs, or did you just connect it up? If you just connected it, it's probably got a whole heap of redundant drivers for your old motherboard resources.
