Hey Bat,

I can tell you but then everytime your dad clicks on it, it will show him a restricted access message and the first person who he will suspect is you.

Also, doing this will need you to edit the Registry and I don't want to indirectly ruin your computer by giving you advanced instructions you may fail to follow carefully.

And before you do all that, you have to create a System Restore point just in case. All these are advanced (for you). And by doing all this, I am getting in the way of your dad who is rightfully trying to keep you safe from viewing pictures of naked bitches who have no life and pornstars who will corrupt the young mindzssss.

I am not trying to impose any morals on you as I believe in human nature but when your dad is specifically looking after what you are doing on the internet, I feel it is wrong for me to barge in and impede that.

So the risks and disadvantages outweigh the benefits.

Just do this...this is new:

Go to Internet Options --> Click on the Advanced tab all the way on the top right --> Scroll down in the small window till you reach "Security" --> Click and check on the "Empty Temporary Internet Files folder when browser is closed" option.

Now everytime you close the browser, it deletes the items in the TIF folder. You still have to delete Cookies and History though! And when you delete History, make sure to check on the "Delete Offline content" option.

And you have to close the browser. If you do all these things and don't close the browser, there is a chance it will still show you the History.

Have a nice day!
