I have this problem *only* with glacier flying. My FPS goes down to about 2. And it is completely unplayable. I'm not exaggerating, I have to sit out the whole game until it passes, sometimes it doesnt even pass. I sit there while my computer is lagging, "not connection/interenet lag", "performance/computer lagg".

I see no reason why my computer does this. Every and all the other maps i've played have never ever done this, even ACK's other maps would never do that. For some reason theres somthing wrong with that map because ussualy mid game that happens. I close down all running programs that might have a small small performance eater, same problem. I tried defragging it out, I've tried formatting it out. I really want to be able to play this map without this lagg, Any suggestiongs?

My computer specs shouldnt be the problem.

Windows XP Home Edition
P4 1.5Ghz
ATI Radeon 8500/LE
768MB RDRAM
