Does it happen every time that you play on this map? I tend to have a lower FPS overall on this map compared to others. There are times where I have had a bug that sends my FPS to 1. I have experienced it on Islands, Canyon, and City. I know that others get it from time to time as well. I don't think it happens enough that anyone has looked into fixing it. If it has something to do with the Glacier Flying map only, then it is an issue that I have not seen or heard of till now, but it sounds much simmilar to what has happened to me only about 3 times in the year that I have been playing Renegade. I have no sugestions at this time, eecept this: Try hosting a 1 person server game with this map only and see if it happens to you. This may tell you if it is the server host, or your computer freaking out. I would not rule out that it is a problem with this map except that I have not heard of anyone with this problem. Sorry! Wish I could be of more help.
