What I was think is that i could cut off the plasting thing off a little from the wire that is on the cpu cooler and then add the wire of the new fan in the cpu wire.
My dad says that it will slow down the cpu cooler. Is that true?

Splitting any current is often a bad idea, no matter if it's in a computer, or a car.

If you have no idea on how to install a water cooler, then you shouldn't even bother with tinkering with the computers internal circuitry.

Take it to a professional.
