I pretty much only know c++. And not really *that* good with it. The thing with programming is that once you've "mastered" a complex enough language (like c++) it's relatively easy to learn more as the basic idea is the same. All you need is a tutorial or two and you can start working on stuff.

C++ isn't the easiest language to start with, I'm told, however it's not really that hard + it's widely used and can do lots and lots of stuff.
