i had a problem that was like that once. but i couldnt connect to WOL!!! the problem for me was a sys process called "svchost.exe". some new app i got was making it hog my entire CPU!!! i couldnt get any internet activity going, not AIM, not weatherbug, nothing. open the task manager and make sure that no one process is taking up 80% or more of your processor. and it took alot for me to get that process down past 95%!!!
