I only get one set when I import the w3d, then I delete them... but then when I merge them with the male.gmax I get doubles again?

How should I fix this to where I only get one set that will bind to the cross bone and move with the animation?
are you sure you didn't accidentally save overwritten male.gmax? because i do it all the time and it worked

Could you post the male.gmax file for me to download to make sure it is the right one? I don't really wanna go download the whole Renegade tools just for one file...

Edit: I open the male.gmax by itself and sure enough there are doubles....
