Hiya, I found the solution yesterday, so I signed up, but Admin had to approve account first

Anyways I was getting this problem randomly yesterday, I live in London btw, what I did was follow the speedtouch solution, even though I do not have a speedtouch.

Here is what you do, open up your gateway in your browser, then find the UPnP option, and make sure it is switched ON.

I did this, and Renguard worked immediately.

I hope this helps everyone else.

EDIT: To find your default gateway address go to Run type CMD and in the black box type in "ipconfig" (without quotes), you should find it listed, usually its always 192.168.1.1, but it can differ.

EDIT 2: A little strange, I decided to try and turn off the UPnP feature to see if Renguard stopped working, and strangely it did not, it still works, I am not going to complain, but I suggest you try it none the less, if it works, then hey diddle dee doo.
