They say that for a lot of things. "If concentration of THIS was just a little bit less or a little bit more, life couldn't be sustained."

However, when you think about it, it isn't really that amazing that the concentration of forces and elements are so perfect to hold life.

Why? Because it's only measuring life by our standards of living.

If you support the theory of evolution, then reason stands that even if various concentrations of universal forces and matter were totally different from what they actually are, life could have just as easily been created... however they would be living under those circumstances saying to themselves "wow, if our planet had even the slightest bit of oxygen, we could have never had a chance at life!"

And that doesn't just count for life forms, it would also count for stars and planets as well. Perhaps in another universe, stars don't exist because they couldn't be created. That doesn't mean life couldn't have found another way. Sure, it would mean that OUR life would be impossible (or perhaps even the stability of OUR universe as we know it) but it doesn't mean that some other way for life to develop couldn't have taken place instead.
