Ok, well I have had a PHP proxy script for a while on my server so that I could get around my school's internet security and check out these forums now and then, but I could never log in and post, and I was just looking on hotscripts and found a much better one. I uploaded it to my server and changed the settings I felt like changing, but it does require you to have CURL compiled into PHP. I just did apt-get install php4-curl and restarted my server, and BOOM! it worked! It's called PageForward http://www.hotscripts.com/Detailed/53478.html I'm actually using it right now and the webpage looks just fine, nothing is screwed up, and I can login and everything just fine. You can also play flash files and such just fien with it.

I posted a topic on this months ago.

I'll dig it up it had a few more proxies in.

[EDIT] Found it: I know they're not scripts but they're still useful: (many most likely won't work now)

or.....

Remote Desktop to your home PC and connect to internet from there

Yeah, but my school blocks us from using any programs at all except for the ones that they allow us to, word, photoshop, calculater, crap like that, and we can't download or install programs unless we know admin (which I do know)however just a basic user account can't do crap, and I found this script interesting because it's free and unlike most of those free ones online I have found, you can actually login to forums and such with it. Also my school blocks all those proxy

websites like megaproxy, anonymiser, the cloak, and other such known websites, but my school doesnt block my website, even though they know I have a proxy on it.

fair enough, lol

i had to make my remote desktop port 80 before i was able to connect to the PC!

I'm suprised at how many people do not know this.

No school blocks Google. If they do, they need to be burnt down.

Google is your friend. That's why I use Google to bypass filters.

How? Simple.

http://www.google.co.uk/language_tools?hl=en

Scroll on down to "Translate a web page:". Translate the page you wish to visit from German->English (or Anything->English) then hit Translate.

Boom. Instant filter-bypasser. Always works for moi.

I never considered using the translator as a bypass, nice find. I use google cache quite a bit.

Didn't work for me either. I suppose it all depends on how the school blocks websites.

Our school blocked by ip addresses as well as domains. They've probably updated it since I left, I wouldn't know.

www.sourceforge.net/projects/poxy

Theres a php proxy script that includes base64 encryption on the urls so they cant block by input either!
