Hey there

Before WOI went down, Renguard gave no problems on my computer
Then I played via Gamespy, and Renguard killed my renegade process (probably because my WOL nickname is differen then my Gamespy nickname)

But now that WOL is back up, I wanted to play with Rengaurd again.

The only problem is that the program doesn't want to start properly anymore.

I don't get the internet screen, I do get the lower screen where I get welcomed, I only can't say launch Renegade because Renguard now uses almost all of my CPU capacity

I haven't downloaded any patches or updates lately.

How can I get Renguard to work again ?
