I imagine that either -

1) your download was hijacked, or

2) You already had the trojan, and it chose to infect that program.

I doubt APB include a trojan in their files.

Well generally no, you will not even know its there until a virus tries to execute, however if you have a poor system then anything is possible.

Yeah, it's not uncommon that files that you trust get flagged for a false positive. It really takes common sense to figure this out.

It happens.

Like for example Zone Alarm classified Live Messenger as a spyware/virus, so I deleted it,
downloaded again, and now it is fine.

I guess it got infected by a virus, just like what happened to the thread creator.

Wild Conspiracy theory:
Maybe The Reborn team is attacking Renegade Alert(I do not care if it has different name, to me it
will always be Renegade Alert), by making a virus that attacks it?
I mean with the mod in development for so long I am sure they had plenty of free time
Just kidding.

I am a major pirate and AVG works just fine. You need to stick with reliable release groups and stay the hell away from crack sites. Places like Demonoid (When it comes back) are VERY reliable because its an exclusive club, no one wants the ban hammer so they don't risk their accounts.

Really though you should just move on to Usenet, there really is no better.

You see there a HUGE difference between Norton and Nod32. Firstly Nod32 doesn't run like 10 processes just for an anti virus and secondly, Nod32 actually works. While Norton just fails on all levels. It takes like a week just to uninstall Norton.

The only time you would see lag from Nod32 is if 1) you're running an active scan and playing a game and 2) when it installs auto updates.

I'd rather have a 2 sec lag spike to keep safe than to have norton hogging all the cpu/memory and not actually do anything except make the internets impossible to use.

View Forum Message <> Reply to Message

I use Norton 360, I feel safe with it, but I only turn it on when I need to do a check, having it forever on, lags your system to crap.

So, once a week or month is alright for me.

By...going to the internet. Retard. Your brain won't help you if your motherboard BIOS died because of a virus attack.

Subject: Re: TROJAN !!!
Posted by Ghostshaw on Sat, 15 Dec 2007 13:35:52 GMT

You can't get a virus by going on the internet. The only way to contract a virus is either by an exploit in the operating system you are running, or by running an executable that contains a virus.

Exploits in windows = starting the machine up.

Subject: Re: TROJAN !!!
Posted by Ghostshaw on Sat, 15 Dec 2007 16:37:09 GMT

Don't BS, if you keep windows up to date and don't use IE and you are behind a router its impossible to exploit.

All that windows is so insecure crap is way passed. The current XP is pretty damn hard to compromise. Most virusses are spread by social engineering anyway.

Maybe the FBI should use Windows XP, update it and stay behind a router. Prehaps that will stop them from being exploited.

Nothing is impossible to exploit.

TS probably got exploited somewhere on a malicious site. Now its attaching itself to executables, nothing to worry about as it has nothing to do with APB. I would recommend using a different Anti-Virus though.

But theres always a way to connect to a computer. Otherwise we would have the perfect OS or the perfect Firewall. No such thing exists and will never exist. Everything is expliotable.

Just because the average joe can't do it doesn't mean it cannot be done.

I think what Ghost means is that the most secure PC is one that doesn't have an internet connection. When AVG warned me I had some sort of downloader virus which was trying to download stuff, I pulled the network cable out. No matter how well written the virus is, if there's no i'net connection and it wants to download, it can't.

What I mean is this: for a virus to communicate with your PC (IE infect) there needs to be either a listening or a connecting socket. A connecting socket is what we usually use to open web pages and such. Its hard to infect through unless theres an exploit in the program using the connecting socket.

The real vulnerability lies in listening sockets. Those accept connections from other PC's. Most of the automatically spreading virusses go through these and the specifically 2 windows components.

One is windows DNS server (which somehow is on by default, but is easily secured by your routers firewall), and the other is RPC (which needs to be on, but can also be secured by your routers firewall).

Funny thing is that all those software firewalls don't protect these 2 services properly because they can't properly block the socket acceptance.

The real problem with a PC is like someone else already pointed out the user behind it. Don't open suspicious executables, or other files, block ActiveX if your use IE, and if you use any other browser make sure you stay up to date. Oh and the occasional virus scan is nice too.
