The renegade disks are supposedly "Copy protected" but I wish to copy them and keep the originals scratch free.

Ashampoo 2008 won't let me do this, claiming its copy protected and bla bla.

MagicISO only does 300m in the unregistered version.
Can someone please tell me what program I can use to make a disc image.

Also something I wish to post here that I feel quite funny, I bought renegade again about 2 years back as I had lost my original serial. When I received the package it had two, different working serials! Lol.

I don't understand what you're doing wrong with MagicISO. I can do it just fine in the trial version.

No need, copy the contents of both CD's into seperate folders on your desktop, burn the files in each folder to a CD (set it do data CD). Also, make sure you have show hidden files enabled because (I think) there are 2 hidden safedisc files. n_P.

Ty, i thought that most discs that are copy-protected won't work unless the data is in a special order, hence the need to convert it to an image.

You could always create disk images with Nero. However I am unsure of any trial versions. I use the full version that came with my DVD drive and it has been working great so far.

Alcohol 120% FTW. It lets you create a Virtual Drive where you can mount .iso files as backups. TBH, you're better off using the no-cd crack from RenHelp.net

I concur with this, however, sometimes i still use Daemon Tools

sadukar09 wrote on Fri, 04 January 2008 14:51If he wants to play Single player, he needs the CD for the movies.
Can't you circumvent that by copying the movies to the harddrive? Should be possible, though I can't test it right now, no renegade CD's here

Subject: Re: CD duplicates for Renegade

Yes, place the movies in data\movies\

I use Daemon tools to mount and a number of different programs to create images, depending on whether they're copy protected.

I have cp2 so I have the no-cd *cough* unofficial *cough* crack.
Just the SP movies and the fact that I end up re-installing ren at least 3 times each year.

SO putting a dir called movies in the data folder will work?

Use Nero or Alcohol120%, both good at making direct copies, no stopping because of copywrite and other protections.

Daemon Tools, Alchool 120% sucks :/ Why have a burned copy of the image when you can:

1)just copy the files and paste on another CD=100% copy.
2)mount the .iso, always have them mounted for the videos etc.

#2 wins everytime..

#2 fails when your harddrive crashes, so I would do #1 anyway, but use #2 normally.

Both fail for moderen games. I managed to tweak my F.E.A.R into working, but the patch stoped it
^^. You should be allowed to back up your games without being called a "pirate".

How dumb can you be to buy a HDD that acually fails/crashes LOL?
(Not saying you specifically, but to anyone that, that does happen to).

My hardrive is running in a jar of ketchup. Hasn't failed since 1958. Although "working" had a different meaning back then when it came to computers.

QFT
It is a given that a harddrive will eventually fail. The question is when... Sometimes it is within a year, and sometimes a harddrive can live like decades.

Indeed, I had a WD that lived just under six years under really heavy use. It went out with a puff of smoke...

Ok g33k. Um, how long do they last? Long enough before its time to switch to a new comp anyway. By the right one, and there will never be a problem. Top of the line comps last about 4 years, who buys a HDD that doesn't last 4 years? Your supposed to look shit up before buying one, you dont, its your own fault.

Dumb fag, some people don't waste their money on buying a completely new computer, but upgrade things like motherboard, CPU memory videocard, and perhaps case/powersupply.
I have harddrives here that are somewhere between 8 and 12 years old, in a system which average age is about 3 years. Works fine really.
True harddrives are a bit slow, but that's not a problem as it is only used to serve some webpages etc.

Also, I have had serveral harddrives fail within 1 year, which where replaced under warranty, but still, data is still lost. Oh btw, it where your great WD branded disks...

Edit:
Oh, another thing, our server runs on 6 to 8 year old SCSI harddrives, which are still faster then most modernday hardrives you'll find in your computer. (Not counting Raptors, or newer SCSI/SAS disks)

Also not counting some seriously fast RAID 0'd Samsung solid state disks, I take it? (Those are fast, bloody expensive though, well over £300 for just 64 GB)
