Does anyone know how to create the following effect in gmax/3dsmax? It is somewhat like the flashing red light on top of a nuke beacon, wich is not done with emitters. I would like to know how to do this. Thanks.

Captured with w3dviewer:

Use firefox to see it animate at the right speed.

i think you have to animate it in gmax/renX

Use GRID in the textures uv channel? (sorry I do know it is grid, but I don't know what the drop down area is called, I still have to reinstall gmax and RenX again).

It is probably a grid texture. Open it up in W3d viewer so you can see the texture names and then locate all of them in always.dat.

-post deleted, I found the solution I was looking for-

It doesnt involve any grid texture.
What you need is

and a small, 1 pixel wide texture with your flash pattern.

Create a plane, hit M, and do this.

At this point my gmax crashed. No save. Anyway...
Texture 1 is the flash. Texture 2 the gradient.

This "should" work.

But how do you put 2 textures on 1 'plane' object?

After i setted everything the same like you (I am also trying to make this for vehicles) my renx doesnt crash after doing it btw. But when are you supposed to attach those 2 textures/pics you posted in previous post?

oh lol i only attached the sun.tga texture and it works i tried it on one of my vehicles and it looks pretty good! i only didnt place them in the right spot yet and it doesnt flashes as you wanted but that doesnt matter because it works

I am glad you posted about how it should be done if your renx keeps crashing i might be able to

do it for you (if you explain how to add the other little pic you sended to make it flashing).

The crash was no serious issue, I just didn't feel like recreating this sample.

The last stap should be pretty simple.
Stage 0 Texture: lightflash.tga
Stage 1 Texture: gradient.tga

Hit apply, and you're done.
You dont need to do anything else when working with just one plane.

-edit-

You could give gradient.tga some funky colors to create a light that changes color all the time.
You can also play with the Detail Color on the shader tab.
Set it so something else than scale to achieve random effects.

You had to go and ruin a perfectly beautiful Dodge Challenger...

Thanks slave it works!

If you got more of this little tutorials for making stuff in renx, why dont you upload them on www.renhelp.net? will help alot people.

Yes, I could and might do that one day.
But right now I lack the time and patience to do so.

But who knows.
