When I log into my router it shows my moms pc in there twice in the clients list
like this

192.168.xx.xx BLU3Y3Z-PC
192.168.xx.xx unknown
192.168.xx.xx TRACY-PC
192.168.xx.xx TRACY-PC

and my mom is Tracy BTW now it shows both with diff ip address at end and both have different
mac addresses and i dont know what that extra one is, i tried restarting my router disabling
everything etc

Well turn off the connection from your mams computer and see what one disappears. If they both
do then its probably a firmware glitch.

Show us the actual IPS tbh, 192.168.x.x is a local IP is not accessible outside your lan. maybe for
some reason her IP changed and so it registered the new client, but didn't unclear the original. Is
this showing in your DHCP or active clients? If it was in the DHCP , did you change networking
adapters at all?

Is this a wireless router by any chance? First thing I would do is shut down her computer and
recheck the list.

An easy way to check is just compare the mac address in the list

Start->Cmd -> ipconfig /all

But yeah, is this in the DHCP settings/list or in the status window/list

Nope, One says

192.168.2.2 TRACY-PC

other says

192.168.2.3 Tracy-Pc

hint not all caps?

no my mom uses a wireless version chip but never did anything, and dont uise a router just its own ip

i restarted router, and both our pc,s and no other pc is on in house =/ its like theres a nother pc on our network with my moms pc names

genetix wrote on Fri, 02 January 2009 16:36Is this a wireless router by any chance? First thing I would do is shut down her computer and recheck the list.

yes wireless but only 2 pcs on and connect threw a wire, one is mine and my moms...i few days ago i took out my moms wireless card

not helpful

dont think someone hacked me since its this way even after hours of router off
my network is
mac filtered (excpet that extra TRACY-PC connected to it
a looooooooooong password with everything on a WPA2
and....ya...

you said you took out the wireless card? Has the wireless card ever accessed the router (even by accident)

Have you tried rebooting the router? The router will map the IP to the mac address for the lease time in your dhcp settings. If it was dynamically mapped then it'll clear upon reboot/lease timeout, otherwise if it was statically set it will still be there. Aside from this i cant think of anything else

Ya it has, Right now i did a full reset of my router when im done setting it back up im turn on my moms pc and see what ip it gives it

i wonder if its my router
its old
always lossing connectiong
takes 30 min to connect
gets over heated
etc etc

Oh well thats one way to fix the issue haha. It'd be a pain in the ass to do that due to my portforwarding setup >_<

A few things i would check:

* Make sure the PC is wired or wireless. Not both
* Reassign IP-adresses and remove any reserved ones in the router
* Make sure the PC isn't running anykind of server software (Windows NT, 2003, 2008) This causes the router to give more IP's to the machine (my server has 10   )
* Check that at your networkcards (where you can add/remove protocols etc) that non of the connections have been bridged by accidend.

I hope this can help you a bit

Not automatically, you need to manually assign them...

My server 2003R2 had uses 10 IP's as Default after installation for IIS etc. Afterwards you can
lower them but i didn't so i still have 10

SSnipe: sorry but that was all i could give you atm
