I'm making a W3D blender suite that should enable Blender to become a legit way to author renegade content. This addon is planned to both import and export w3d files as well as render the materials in a way that's similar to the game engine.

Get "Revision A" import preview, and first code release!

What benefits would Blender have over a pirated copy of 3DS Max 8? Blender's interface has always been annoying.

Both blender and max are annoying in different ways IMO. I'm doing this because it's fun. Maybe I'll make a 3dsmax9+ kit in future if it works out. : p

Progress tonight: Materials can have multiple textures. Material vertices don't blend - so they're actually per face, duplicating vertices at borders.

Looked into the duplicate materials. They seem to be perfect duplicates. My favourite test subject, the airstrip, has: concrete, tarmac, cement, lightmap, concrete, tarmac, cement, lightmap.

What's still not clear is why. I thought, maybe it duplicated for every shader, but then you have other models which have varying numbers of material pieces...perhaps it could even be RenX weirdness?

Something interesting though. Ignoring the duplicates, materials don't overlap... except for the lightmap, which blankets everything. Lightmaps could well be a special feature that they've just shoved in there, if that turns out to be the case then it can be treated as such.

Good luck with with this yesfish and keep us updated! I think jonwil and Saberhawk are the best people to talk with, when it comes to W3D

Aircraftkiller wrote on Tue, 22 May 2012 14:22What benefits would Blender have over a pirated copy of 3DS Max 8? Blender's interface has always been annoying.

IIRC, 3DS Max 8 uses MaxScript **only** for scripting. Blender and newer versions of Max (and Maya) support Python, which (apart from being a very lovely language and by what I can tell what yesfish is writing the W3D suite in) is widely used and easy to learn, so people making W3D content would have access to a pretty big database of free scripts (and could make some of their own, tbh).

I personally haven't tried Blender yet, and I'm not sure how it's features will interact with the W3D stuff, but depending on how yesfish pulls it off you could make use of the built-in game engine (which, I've been told, is the feature that makes it stick out, when compared to other modeling packages).

Latest update.

99% sure the duplicate VERTEX_MATERIALS are an exporter quirk and can be ignored.

Here's the theory: Mesh is broken into triangle patches by duplicating vertices. Each patch gets its own custom layering.

every patch:

 every pass:

 vertex material link

 shader link

 texture link

 uv map

All those links there are mix and match, you get a large sandwich of information. Which is great, if you're a game engine.

So I think the best way to get anything meaningful is to treat each uniquely layered patch as a separate material, on export, re-combine and sandwich everything. It seems this is how RenX works.

Will post further updates when I have something new to show. Probably by early next week.

I have yet to find a copy of 3DS Max 8 (legal) as they upgrade only seem to sell the most recent release. And all the pirated torrents seem to contain viruses.

This will allow people who have things against pirating and aren't rich, or just don't want to risk getting a virus, to mod for renegade in something outside of RenX.

Plus I'm sure there are plenty of people that just hate 3DS Max's GUI.

And you never know, better import tools might come out of this in the end (ones that actually assign imported materials); and god knows that'd be nice.

Seems that I lied, no images this time. It turned out to be a little more difficult and also life suddenly got busy but since last time I've managed to create a function that transforms all those layers into materials.

There are three rendering options which are simultaneously present to support different quality modes. Vertex Lit, multi-pass, multi-texture. Anyone know which is considered the 'best'? My instincts say multi-pass as it matches directly with RenX material editor. But multi-texture looks like it was added after multi-pass. Multi-texture is also a little weird, it could be an issue.

Plan of development from here:
processed materials to blender materials
uvmaps and vertex colors to blender
clean up code and make it a module
release first source preview

Second version should have object hierarchy, w3d exporting and hopefully some full GLSL previews of those w3d materials.

From there it's lights, all those other nodes and attributes and the final boss: vertex weights and animation.

My documentation is this source code by Jonathan Wilson:

<http://sourceforge.net/projects/rentools/files/w3dview/>

After studying the source for a few hours, I'd got 3D models loaded. Then I started on the materials and 2 weeks later, same place, lol. Figuring out Blender has taken the majority of the time of course as this gleaming open source API has worse documentation than a dead proprietary format.

Github is the hip place to be so yeah that's probably the best place.

First preview will be ready next week I think.
See original post for latest screens.

Now samples passes into materials, UVMaps, vertex color maps, vertex alpha maps (not sure what to do with them so set white = transparent, black = opaque. might swap them in future), optionally ignore lightmaps, sorts hidden / VIS objects into layers and is a proper addon.

They are actually lighting modes and not exported from RenX. The WW workflow was to export something from "RenX" and bring it into a lightmapping tool (which wasn't released), calculate the lighting for the level and transform the bare material/shader/etc chunks into copies configured for each lighting type.

Now available for download. If you want to play with it and point out all the problems, you can find it at the start of the topic.

Thanks saberhawk. In light of that information, I think the best way to go is to ignore multitexture, try to load multipass and fall back to vertexlit. Some meshes seem to have materials missing so I'm thinking perhaps they don't support PRELIT_MULTIPASS.

(I bet I'll end up having to parse MULTITEXTURE though)

Things are getting a little weird now

The goal is in sight now yet some things are very mysterious. meshes pulling bone data from other files without any reference to them other than making wild guesses about filenames, level of detail meshes that reference the same hierarchy, there's no differentiation between matrices or bones and aggregates that give dr moebius exchangeable heads. It's like a taco inside a taco inside a Taco Bell inside a KFC inside a mall inside your dream.

The big picture is just out of reach. Could it be some super hierarchy of models that transcends .w3d and .mix files? Will keep slugging it, but any more info is appreciated.

Welcome to Renegade

C_AG_GDI_MOBO explicitly pulls in C_GDI_MOBI_ which explicitly brings in the hierarchy from S_A_HUMAN and implicitly brings in the 4 LOD meshes C_GDI_MOBI_L0 to L3 (the HLOD from

these is ignored). It also explicitly pulls in C_GDI_MOBI_HEAD and attaches it's HLOD to "C HEAD" from S_A_HUMAN. One convention to note is that the file name of a W3D file needs to be the name of the primary object inside it, and that other files can be brought in using the dotted names (ie C_GDI_MOBI_L3.BODY3 loads c_gdi_mobi_l3.w3d and grabs the BODY3 mesh.) Renegade itself handles this by having an "Asset Manager" which can load things on demand if they haven't already been loaded, otherwise it just makes a copy.

Aha! So the HLOD is basically some magical botched resource puller. Mix that with aggregates and that's the complete picture...

Stuck.

Importing, fine. Still need to do the object attributes and some material shader values. But you get a complete picture of the scene.

Exporting, even though wdump reveals a structure that's as standard as any mesh and even though you can then reimport the exported mesh into blender and it works FINE, open it in w3dviewer and watch the materials disappear.

And I'm sick of Blender's shitty API. Features you'd expect are missing, features that are there are hidden or undocumented or don't work the way they should. e.g. BMESH the new n-gons structure has a whole neat set of polygon splicing features, but can't even triangulate a mesh. And I'm going to have to add all this missing functionality myself if I want to finish this thing - but at this point I'm sick of the whole attempt. Getting Blender to work has been far worse than trying to get my head round W3D.

Sorry I haven't been on here for a while.

Last summer my forever sketchy sleep problems became chronic. I live in the UK, healthcare is free, but it is SLOW. 4 months waiting time for a doctor to tell me that "yep, you're tired" kind of slow. With very limited waking energy to spare, life has had to come first.

So I'm thinking, if everything goes okay, in a few months I might have some time to work on it again, with an improved plan:

1) Separate the w3d interpreter part into an xml<->w3d python module that you could use in 3ds max or blender, etc. which should fix a bunch of issues and make it a general purpose tool for all modders wanting to do stuff.

2) figure out the many issues with Blender and the w3d format and get the damn thing exporting workable models.

Might not be the latest, found this script from 2007

just overwrite (max)/scripts/startup/Abjab's-W3D-Importer.ms with Abjab's-W3D-Importer.ms (2nd link).

EDIT:

Here is a working prototype of the xml<->w3d python module I mentioned in the last post. The purpose of being a standard library and reference for the format...

https://github.com/huwpascoe/w3d/blob/master/w3d_elem.py

Currently can only w3d->XML files. The code is much nicer than what I was doing last year but I know the format well now.

Every chunk is defined in a simple array and read with a small set of functions. Once it's done you'll be able to both use it to read-write w3d files (if you have a python project) or use it as a reference for the format.

So neat and clear!

```
{
  'name'      : 'mesh_user_text',
  'code'      : 0x0000000C,
  'attrib'    : [['', 'string']]
},
{
  'name'      : 'vertex_influences',
  'code'      : 0x0000000E,
  'subname'   : 'id',
  'subattrib' : [['', 'uint16'], ['_padding', 'uint8', 6]]
},
{
  'name'      : 'mesh_header3',
  'code'      : 0x0000001F,
```

```
'attrib'      : [  
    ['Version', 'version'],  
    ['Attributes', 'uint32'],  
    ['MeshName', 'name'],  
    ['ContainerName', 'name'],  
    ['NumTris', 'uint32'],  
    ['NumVertices', 'uint32'],  
    ['NumMaterials', 'uint32'],  
    ['NumDamageStages', 'uint32'],  
    ['SortLevel', 'sint32'],  
    ['PrelitVersion', 'version'],  
    ['FutureCounts', 'uint32'],  
    ['VertexChannels', 'uint32'],  
    ['FaceChannels', 'uint32'],  
    ['Min', 'vector3'],  
    ['Max', 'vector3'],  
    ['SphCenter', 'vector3'],  
    ['SphRadius', 'float32']  
]  
,
```

Still todo:

enter and/or figure out remaining unimplemented chunks (52 left to go)
verify that I correctly guessed the format of the vaguely commented chunks
check data formats (right now everything is barfed out as a string)
XML -> w3d function
utility functions, make it a module.

I don't know when it will be finished.

https://github.com/huwpascoe/w3d/blob/master/w3d_elem.py

The library can now do both w3d->xml and xml->w3d. I'm so happy, it can convert to and from

files already without any data loss!*

It just needs a bit of a cleanup, some testing and perhaps some detective work to verify every chunk of the format before I can declare it OK.

*random junk left by C++ exporters that don't initialize their structs to 0 is lost.
